

A/D conversion:
 1. Sampling, Quantization
 factor: Sampling Rate
 2. Signal-to-quantization error (SNR) Nyquist frequency
 3. sampling rate 滿足 $f_s \geq 2f$
 使 quantization 精確度提高

RLE: lossless (run-length-encoding)
 (256, 6), (242, 4), (238, 6), (233, 4)
 Entropy: Shannon's equation
 $H(S) = -\sum p_i \log_2(p_i)$ 機率
 RLE: 原本 64 → 11 組 × 2 個
 compressing ratio: 64:22
 image histogram: 
 Mean of average: $\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$
 $\sigma = \sqrt{\frac{1}{n} \sum_{i=1}^n (x_i - \bar{x})^2}$

Bilinear interpolation:
 Let $A(i,j)$ be the original image (100x100)
 $B(i,j)$ be the scaled image (300x300)
 for $(x=1 \sim 300)$
 for $(y=1 \sim 300)$
 $p=x/3, q=y/3$
 $i=floor(p), j=floor(q)$
 $sum=0$
 for $(m=0 \text{ to } 1)$
 for $(n=0 \text{ to } 1)$
 $H=(1+(1-m)*p); i=i+j*n$
 $T=1+j*(1-m)*q; j=j+T*n$
 $W=H*T$
 $sum=sum + A(i,j)*W$
 $B(x,y)=sum$

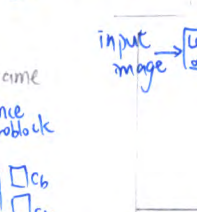

Bezier curve: a parametric curve described by polynomial based on a sequence of control points.
 $(3n+1-4)/3 + 1$ = 第一次用 Bezier curve 為 4 個點，之後都會與上個 P_2 重疊一次，∴ 從後的花 3 年

MPEG compression:
 I: interframes: are compressed independently, if they were isolated still images, using JPEG compression, serve as reference for the B/P frames.
 P: 參考前面的 I frame 來做 compression (forward prediction)
 B: bidirectional frame: 參考前後的 I/P frame 做 compression.
 motion estimation: video 有多張圖片串連而成，若每張圖都用 JPEG 壓縮，效果不好，藉由 motion estimation 記錄前後 frame 的差異，針對 difference 來壓縮，能減少重複儲存相同部分。
 SAD let p,q be the position of T block in the target frame then the search range in the reference frame is (p-15, q-15) to (p+15, q+15)
 for $(i=p-15 \text{ to } p+15)$
 for $(j=q-15 \text{ to } q+15)$ $0 \leq x,y \leq 7$
 $SAD(i,j) = \sum_{k=0}^7 \sum_{l=0}^7 |T(x+k, y+l) - R(x+k, y+l)|$
 if $(SAD < min)$ $min = SAD$
 record the corresponding position of min
 (assume m,n)
 motion vector = (p-m, q-n)
 flow chart: compressing a P frame

 full-search Motion vector
 2D-algo: thm

Aliasing: Sample rate 低於 Nyquist rate 則 $r=2f$
 導致原始訊號無法從取樣中还原。
 Dynamic Range: ratio of the largest-amplitude sound color and the smallest that can be represented with a given bit depth.
 Dithering: is a technique for simulating colors that are available in a palette by using available color that are blend by the eye so that they look like the desire colors.
 決定 index color: finding the color that is most similar using the min mean square distance
 $\min (R-r_i)^2 + (G-g_i)^2 + (B-b_i)^2$
 Bitmap: 利用矩陣存圖，每個 pixel 存一個資料結構 (陣圖)，儲存快，檔案小 hard to edit / fast to create
 Vector: 利用數學函式計算 graph 的向量圖，易修改，放大，小較精確
 Filter: is an operation performed on digital image data to sharpen, smooth, or enhance some feature

Interpolation 比較:
 NN: 快, poor quality
 bicubic: 慢, very good
 bilinear: 中, 中
 AC component: $A_n = \frac{1}{N} \sum_{k=0}^{N-1} f_k \cos(2\pi k n / N)$
 $b_n = \frac{1}{N} \sum_{k=0}^{N-1} f_k \sin(2\pi k n / N)$
 magnitude / phase form of the inverse DFT: $f_k = \sum A_n \cos(2\pi k n + \phi_n)$
 magnitude 表示實際 freq domain 上的 amplitude
 $y(n) = h(n) \otimes f(n) = \sum_{k=0}^n h(k) f(n-k)$ FIR filter → convolution between signal f and filter h
 IIR filter: recursive form = $h(n) \otimes f(n) = \sum_{k=0}^n a_k x(n-k) - \sum_{k=1}^M b_k y(n-k)$
 算出 f 和 h in freq domain: 用 DFT $\Rightarrow F = DFT(f), H = DFT(h) \Rightarrow Y = F \times H$, 取 $DFT^{-1}(Y)$ 得 f 和 h

④ cubic bezier curve: $P(t) = (T^*M)*G = (1-t)^3 P_0 + 3t(1-t)^2 P_1 + 3t^2(1-t) P_2 + t^3 P_3$
 注意每 4 個點為一組，前後為 fixed point，中間為 direction point，分別為 $P_0 \sim P_3$ ，執行 Bending function，產生 fixed point 和 interpolated points 為 Bezier curve 的點，再相連。
 下一組的 P_0 為上一組的 P_3 ，直到每個點都做過。
 ⑤ 不含 pass 每個 data point, $3n+1-1$ (不算原本) / 3 + 1 = $n+1$ 個。
 因為每組只有 2 個 fixed point 是原本 data point 的交

PCT used in JPEG compression

 input image → Load → 8x8 DCT → Uniform scalar Quantization → Spatial Quantization table → freq domain
 DC → Differential coding → VLC
 AC → zig-zag scan → Run-length coding → VLC
 3D-graphics: Phong model
 Intensity = Ambient + Diffuse + Specular
 $\Rightarrow (I_{amb}) + (I_{diff} \cos \theta) + (I_{spec} \cos^2 \theta)$

LRGB: used for display monitor, 知人類眼睛感色顏
 色方式相同，為 additive color mixing (有些色彩無法表現)
 CMYK: used in printing, 為 subtractive mixing, 但無法
 呈現黑色 (dark brown)
 HSV: Hue 色相, Saturation 飽和度, Value 明度 (B)
 YCbCr: 將顏色分為 luminance / chrominance 因人類對
 亮度較敏感，用來對資料分析，過濾
 average dithering: 算出平均 pixel value, 高的白，低的黑
 Pattern Dithering: 用一個 threshold matrix 為基準，同上
 Error Diffusion: $(x,y): e$
 $P(x,y) = P(x,y) + (7/16)e$ pixel value
 $P(x+1,y) = \sim + (3/16)e$ ↓ 128: 0
 $P(x,y+1) = \sim + (5/16)e$ ↑ 128: 1
 $P(x+1,y+1) = \sim + (1/16)e$
 When the mask 3 moved to the right by one pixel, the next step will operate on a pixel that has possibly changed in a previous step.
 Noise shaping: is another way to compensate 量化誤差

Move noise's freq to above the Nyquist freq, and filter it out, we are not losing anything we care about in the sound.
 $DFT: F(n) = \sum_{k=0}^{N-1} f(k)e^{-2\pi i k n / N}$; inverse: $f_k = \sum_{n=0}^{N-1} F(n)e^{2\pi i k n / N}$
 DC component: $a_0 = \frac{1}{N} \sum_{k=0}^{N-1} f_k$
 magnitude of the nth freq component: $A_n = \sqrt{a_n^2 + b_n^2}$
 phase $\sim \phi_n = -\tan^{-1}(b_n/a_n)$ $0 \leq n \leq N-1$
 magnitude / phase form of the inverse DFT: $f_k = \sum A_n \cos(2\pi k n + \phi_n)$
 magnitude 表示實際 freq domain 上的 amplitude
 $y(n) = h(n) \otimes f(n) = \sum_{k=0}^n h(k) f(n-k)$ FIR filter → convolution between signal f and filter h
 $= [h(0) \dots h(M-1)]$
 算出 f 和 h in freq domain: 用 DFT $\Rightarrow F = DFT(f), H = DFT(h) \Rightarrow Y = F \times H$, 取 $DFT^{-1}(Y)$ 得 f 和 h

progressive scanning: each frame is scanned line by line.
 Computer monitor: from top to btm, (one field) 3:2
 Interlaced scanning: the line of frame 切成 2 field, pull-down
 1080/60 (FPS)
 frame freq
 take one = the process of transfer film → video and the
 machine that performs the process
 Pull-down: a method for using interlaced fields more than
 once. (cross) frames, to make up for a discrepancy
 in frame rate as film is translated to video.
 $200PT: F(u,v) = \sum_{n=0}^{N-1} \sum_{m=0}^{M-1} F(n,m) \cos(\frac{(2n+1)u\pi}{2N}) \cos(\frac{(2m+1)v\pi}{2M})$
 (a) u,v: freq domain of the vector
 (b) F(u,v): 在 (u,v) 處上 frequency 的 magnitude.
 magnitude 為該頻率對應到 spatial domain 的 amplitude.
 (c) 4:2:0 chrominance sampling.
 一個 sample matrix:

 2x2 sample 4x2 Y, 1x1 sample 2x2 Cb-Cr
 2x2 sample 2x2 Cb-Cr, 1x1 sample 2x2 Cb-Cr
 15x16/64 = 4x2 8x8 DCT, 16x16 block
 2x2 DCT 轉換 64個 spatial domain component
 利用 zig-zag scan, 和 RLE 最後再用 VLC (Huffman coding)

Table for Film A:
